

## Domain/Organization.cs

```
1 using System;
2 using System.Collections.Generic;
3
4 namespace Week3
5 {
6     public class Organization
7     {
8         // made settable so reflection/property assignment from the repository works
9         public string OrganizationId { get; set; } = Guid.NewGuid().ToString();
10        public string Name { get; init; }
11        public string Address { get; init; }
12        public string City { get; init; }
13        public string? Url { get; init; }
14        public string? PhoneNumber { get; init; }
15        public string? Email { get; init; }
16        public List<ContactPerson> Contacts { get; } = new();
17
18        public Organization(string name, string address, string city)
19        {
20            Name = name;
21            Address = address;
22            City = city;
23        }
24
25        // new ctor to allow creating with an explicit id (avoids reflection)
26        public Organization(string organizationId, string name, string address,
27        string city)
28        {
29            OrganizationId = organizationId;
30            Name = name;
31            Address = address;
32            City = city;
33        }
34        public override string ToString() => $"{Name} - {City}";
35    }
36 }
```
